

Module 013 Streaming Engine

Bryan Alexander Buchorn
Independent Researcher
bryan.alexander@buchorn.com

Abstract—This module forms a critical component of the CEREBRUM framework, a community-structured graph attention engine for Knowledge Graph reasoning. It focuses on Advanced Graph Attention Analysis.

Index Terms—Knowledge Graph, Graph Attention, DSCF, CSA, Hierarchical Reasoning.

0.0.1 2.2 Streaming Discretizers

Discretizers transform continuous input signals into discrete symbolic edges. The core discretizers include:

- **Threshold Discretizer:** Continuous float stream $\rightarrow$ Edge emitted when value crosses threshold θ .
- **STDP-Discretizer:** Spike/event timestamps $\rightarrow$ Directional CAUSES edge based on temporal co-occurrence (Δt).
- **Delta-Discretizer:** Rate-of-change signal $\rightarrow$ Edge emitted when $|\Delta x / \Delta t| \geq \theta_{rate}$.
- **Windowed-Frequency-Discretizer:** Event counts per window $\rightarrow$ Edge emitted when co-occurrence frequency exceeds f_{min} .
- **Pattern-Discretizer:** Symbolic event sequence $\rightarrow$ Edge emitted when pattern match probability $\geq p_{match}$.

Each discretizer maintains a small internal sliding buffer and is stateless with respect to the adapter graph. This isolation ensures discretizer failures cannot corrupt the persistent Knowledge Graph.
